

As part of an ongoing commitment to sustainability, Manson Insulation has made it a priority to move away from formaldehyde-based binders. That's why we've replaced our previous offerings with a range of fiberglass insulation made with ECOSE® Technology from Knauf Insulation.

The new fiberglass insulation is a high-quality product that offers a number of environmental benefits:

- **Contains no additional formaldehyde**
- **Comprises more than 50 percent recycled glass (mainly from bottles and windows), with the remaining content primarily derived from rapidly renewable materials**
- **Is a very low-emitting product and has received the GREENGUARD Gold Certification for indoor air quality**
- **Can contribute points to a building's total rating in green building rating systems, such as the U.S. Green Building Council LEED v4 credits**

We believe switching to a sustainable solution is the right thing to do for installers, distributors and our employees. In addition, by heightening the importance of sustainable products in the market, we have confidence that we can eventually drive more demand for them. We're committed to raising the bar for product quality and quality of life at competitive prices.

## Why Sustainability Matters

Using fiberglass insulation made with ECOSE Technology, alongside other green building materials, makes sense economically and environmentally.

### Economically

We offer a higher quality product and more sustainable solution featuring ECOSE Technology at a competitive price.

### Environmentally

As all of us become more aware of the impact we have on the planet, using recycled glass and rapidly renewable materials is one small but very important step to take in building a more sustainable future.

**Fiberglass insulation with ECOSE Technology comprises more than**

**50%** recycled glass
